

EnGenius Neutron Series Wireless Management Solution Delivers Reliability, Performance, Remote Management Capability for Hotel Guest Network

Keenan Systems LLC

Located in East Hampton, Connecticut, Keenan systems is a national distributor of wireless networking products and services. Leveraging a national network of system integrators, Keenan Systems offers installation services nationwide. The company specializes in long-range wireless equipment, hospitality Wi-Fi solutions, metro area wireless equipment, wireless management and monitoring solutions, and wireless network security.

Keenan Systems, an EnGenius Master Reseller, provided technical and sales support to the owner/operator during the selection and deployment of the hotel's wireless networking solution.

The Need: A Reliable, Managed Wireless Network Infrastructure for Guests and Staff

Located in Louisville, Mississippi, the Quality Inn is an owner-operated two-floor, 50 room hotel. Accommodations for business travelers include a small on-site meeting room and basic business services.

One of the most important benefits that the Quality Inn provides to its guests is free wireless Internet access throughout the entire property. This wireless network was also used by hotel management and staff members to conduct daily business activities.

According to Jeff Keenan, President and CEO of Keenan Systems, the hotel was having connectivity issues with the wireless network. One of the issues was that the building construction itself provided some challenges for the wireless network. "In addition to cinder block walls between the guest rooms, they were using older access points and consumer-grade routers," Keenan explained. "The management was receiving constant complaints from their guests relating to connectivity issues and slow network performance." Though the hotel had a working wireless network, its performance did not support the usage demanded by their guests.

Keenan stated that the hotel needed a more robust wireless network solution, but the system would have to provide more than just long-range, fast speeds, and reliable connectivity. The new solution would need to be a managed wireless LAN solution that is easily deployable by person without an IT background, and is capable of being monitored and managed remotely by the hotel's management company.

The Solution: EnGenius Neutron Series Wireless Management Solution

The hotel owner-operator contacted Keenan Systems and asked them to help identify a solution to replace their aging wireless network infrastructure. After considering the available budget, environmental challenges, and the need for a managed solution, Keenan recommended the EnGenius Neutron Series Wireless Management Solution.

“One of the main challenges was that the hotel needed a managed solution, but they did not have a large budget for the project,” Keenan said. “The EnGenius Neutron Series is an ideal affordable solution for businesses that need a managed solution with business-class features, but do not need to have all of the features of an enterprise-class solution.

The Quality Inn purchased the EWS5912FP Neutron Series 8-Port Gigabit PoE+ Wireless Management Switch with Uplink Ports and several EWS310AP Neutron Series Dual-Band Wireless N600 Managed Indoor Access Points. The Neutron Series is a scalable solution that makes it easy to deploy, monitor, and centrally manage numerous Neutron Series Wireless Access Points from a simple and accessible browser-based software platform.

According to Keenan, despite not having an IT background the hotel owner was able to quickly install the Neutron Series Wireless Management Solution without any issues and turned the system over to the management company which handles the actual network monitoring and management remotely from their corporate office.

The Results: An Easy-to-Deploy Managed Business-Class Wireless Solution

The EnGenius Neutron Series Wireless Management Solution deployed quickly and has eliminated all of the guest complaints regarding network connectivity and performance throughout the property.

By replacing the older wireless access points and consumer-grade routers with the new EnGenius Neutron Series, the Quality Inn now benefits from a high-reliability network provided through a series of high-speed, long-range, business class access points. In addition, the ability to remotely monitor and manage the access points through the Neutron Series Wireless Management Switch saves time for the network administrator by making it easy to simultaneously configure and maintain the managed access points and optimize the network performance from a remote central location.

“The ability of the EnGenius Neutron Series to be deployed by a person without an IT background and centrally managed from a corporate headquarters or management company makes it an ideal solution for many small businesses such as this,” Keenan stated.
