#### Removable media

Extra options for throwing your media through the device are located on the side, including USB, Compact Flash and SD slots. Great for slamming the latest tracks from a USB key or some of those trendy USB Mixtapes (see below..)

# Solwise DMP-1120w | £83

[solwise.co.uk](http://solwise.co.uk)

**T**his little device let's you pick up all your media content from your wireless enabled PC or network storage device. It also packs in a USB port and card readers on the side of the unit for attaching content straight to the device. It works with both Mac and PC using various free

or paid software depending on your choice. We used it on PC with Windows Media Player 11 and all features worked fine. It's incredibly easy to set up, picking up a wireless network straight away. Enter your WEP code and you're off. The interface is a bit ugly but it's hard to imagine much money being thrown

at interface design for this teeny-tiny pricetag. Future firmware upgrades will make YouTube and internet radio streaming possible amongst a few other minor updates. Wonder whether Solwise could just you the whole internet via a basic on-board browser? Connections round the back of the unit are component

video, composite video, SCART and phono audio connections. The fact that there's no SCART lead included was a bit infuriating but it's a sexy looking wireless media streamer for under £90. So who's complaining? Highly recommended. *Chris Barker*
